Once the piece is secure, you are ready to mill! One option is a belt change, or step pulley machine which takes a little bit longer and is not recommended if you have many speed changes. To change the speeds more efficiently, you can get a variable speed head, which changes speeds as easy as you can turn a wheel. This allows you to feed your workpiece automatically. Power feeds can be applied at any time and can be put on the x and y axis as well as the knee. This saves time work cranking the handles. This usually has some type of digital numbering system that shows you your measurements on screen instead of using the numbers on the dials for your x, y or z axis. This allows you to pneumatically open and close the draw bar with the touch of a button closing the collets without having to use a wrench to open the draw bar manually to change the collets.

Fans also frequently require a stepdown transformer if the Bridgeport milling machine is wired for power greater than 110 Volts. It also reduces maintenance and makes the machine more sensitive and easier for the operator to use. Operation of the system by a single lever saves the operator time and makes it easy to always provide the correct amount of oil, predetermined by a series of metering valves built into the system. Thus one sliding member may receive more oil than another; possibly causing excessive wear to the area that is not getting properly lubricated. This ensures optimum machine geometry, rigidity and accuracy. Request a quote for current pricing and availability.
